JELLINEK H

1312. THE LYMPHATIC SYSTEM OF THE GALLBLADDER AND ITS PATHOLOGICAL SIGNIFICANCE - Das Lymphgefäßsystem der Gallenblase und seine pathologische Bedeutung - Rényi - Vámos F. and Jellinek H. Urol. Klin. und II Inst. für Pathol. Anat. der Med. Univ., Budapest - ACTA MED. ACAD. SCIENT. HUNG. (Budapest) 1957, 10/3 (295-308) Illus. 9

The lymphatic system of the cat's gallbladder shows dilatation of the lymphatic vessels after ligation of the cystic duct. In contrast to previous results of injection methods the authors showed the lymphatic vessels to be present only in the subserosa of the gallbladder and especially in the bed of the gallbladder. They found few communicating vessels between the liver and the gallbladder going through the gallbladder bed. This communication is of no importance in cases of lymphatic stasis of the gallbladder caused by ligation of the cystic duct. The lymphatic vessels do not take part in the propagation of infection from within the gallbladder with ligated cystic duct, the connective and muscle tissue being the pathways of infection. Concerning the very important clinical question of secondary liver infection from cholecystitis the authors believe that the infection follows the fibre system of the periportal connective tissue where the infiltration is situated outside the lymphatic vessels. It is, of course, very difficult to reproduce by even modified ligation of the cystic duct the pathological changes observed in human pathology. In operative specimens of gallbladder after acute or chronic cholecystitis with signs of pathological alterations in only a few histological sections were lymphatic vessels found, mostly in the subserosa.

22. Mercurimetric Titrations With Oxidation-Reduction Indicators, (1) The Determination of Haloids and Mercury (II) Ions, (2) The Determination of Thiocyanate, Cyanide and Mercury (II) Ions. (In English) J. Bognár, O. Jellinek. Acta Chimica Academiae Scientiarum Hungaricae, Vol. 17, 1958, No. 1, pp. 17-34, 2 figs., 4 tabs.

A new principle is applied for indicating the end point of mercurimetric titrations. The oxidation potential of $[Fe(CN)_6]^{3-}$ ions greatly increases in the presence of mercury (II) ions, thus the end point becomes detectable also by oxidation-reduction indicators, primarily by triaryl methane derivatives. Astra Blue G may be used for titrating chlorides, and the following indicators are suitable bromides: Kylens Blue VS, Patent Blue V, Azure Blue S, Erioglaucine A, p-Xlenolsulphonephthalein, Cyanine B, Eriogreen B, Cyanolecht Green, Brilliantfirma Blue, Setopalin concd., Setoglaucine O, Astra Blue G, Xylenetrianol FF and Formyl Violet. The colour changes are distinct even in the presence of very small amounts of potassium-iron (III) cyanide. The new method may also be applied with strongly acidic solutions. Higher concentrations of copper, cobalt, nickel and chromium interfere with the indication of the end point. Titrations may be carried out with 0.1, 0.025 and 0.01-N solutions. Diphenylaminesulphonic acid is recommended for the titration of iodine. Mercury is determined by an indirect method since colour changes of the indicators are less sharp when mercury (II) ions are titrated with

Hungarian Acad. Sci.

Mercurimetric Titrations With Oxidation-Reduction Indicators, (1) The Determination of Haloids and Mercury (II) Ions, (2) The Determination of Thiocyanate, Cyanide and Mercury (II) Ions

thiocyanates. Thus an excess of thiocyanate is added to the solution to be titrated and the excess is back-titrated by a mercury (II) salt solution.

Przeglad Elektrotechniczny, No. 1-2-3, 1950, pp. 10-17, 16 figs., 9 tabs.

Difficulties in taking measurements arise mainly from the lack of suitable standards, from the indefiniteness or inconstancy of the quantity measured, as well as from the inability to achieve the requisite accuracy in measuring. It can be assumed that the selection of intra-atomic phenomena as primary standard will lead to a final and general system both of basic quantities and units.

Title : Effect of Fringing Field on the Measurement of ϵ and $\tan \delta$ of Insulating Materials.
Orig Pub : Prace Przemysl. Inst. telekomun., 1953, 4, No 10, 9-21

Abstract : An analysis is made of the effect of the field at the edges of a capacitor plate on the measurements of ϵ and $\tan \delta$ of insulators. It is shown that disregarding the effect of the dispersion of the electric field at the edges of the electrode may lead to serious errors in the measurements of ϵ and $\tan \delta$. The existing method of experimentally allowing for the edge capacitance, for example, with the aid of an annular capacitor, are not

applicable when used in the high frequency band. Under these conditions, the effect of the fringing field can be taken into account by introducing suitable corrections in the calculation of ϵ . A survey of various formulas is made for the calculation of the fringing capacitance of a capacitor. The best results are obtained when using formulas with empirically determined coefficients. These formulas can be used in those cases, when the thickness of the specimen is negligibly small, compared with the thickness of the electrode. In all other cases it is necessary to employ the formulas derived theoretically by Kirchhoff and others. The magnitudes of the errors, that are introduced in the use of various relationships for the determination of the value of ϵ , are given. Special attention is paid to the influence of the fringing field on the measurement of $\tan \delta$. This influence can be eliminated in practice by using capacitor plates with

dimensions chosen in accordance with the dimensions of
the tested specimen. In conclusion, deductions are drawn
concerning the most suitable choice of type and form of
electrode for the measurement of the values of ϵ and $\tan \delta$.

(TUBERCULOSIS, MENINGEAL, in infant and child,
eye fundus in convalescence (Pol))

(EYE, in various diseases,
tuberc., meningeal, in convalescence in child. (Pol))

Among 210 children convalescent after tb meningitis the following disturbances were found: atrophy of optic nerves: 7.6%; changes of the eyeground: 19%; healed tubercles of the choroid: 8%; normal eyeground: 63%; besides, impairment of nervous system: 19%, and of acoustic organs: 7%. The findings of other investigators are analysed and the opinion that streptomycin impairs the optic nerve is contradicted. The author is of the opinion that periodical examinations (at least once in 3 months) of the eye fundus in convalescents after acute tb are necessary.

"On The Ultrastructure of Erythrocytes in the Intestine of Suckling Lambs."

Prague, Ceskoslovenska Fysiologie, Vol 15, No 5, Sep 66, p 367

Abstract: Epithelial cells in the intestine of healthy lambs age 1 to 35 days after a feed by mothers milk were investigated. In the cytoplasm of the enterocytes of the duodenum of 1 day old lambs a great number of vacuoles up to 7 microns long was found. In older lambs the phenomenon was not found. The importance of the resorption of food by the cells of the intestine in the transport and metabolism of food substances is discussed. 4 Western references. Submitted at 3 days of physiology of domestic animals at Liblice 9 Dec 65.

TITLE: [Combustion chamber for turbine engines] CZ Pat. No. PV. 2916-64, Class 46

SOURCE: Vynalezy, no. 12, 1965, 21

TOPIC TAGS: gas turbine, gas turbine engine, combustion chamber

ABSTRACT: A combustion chamber for gas turbine engines is described which has the distinguishing feature that the form of the flame tube is formed of segments, for example, of cylinder segments which overlap each other. At the same time a system of segments suspended inside the combustion chamber constitutes the cooling fins.
